

Abstract

This invention involves an electronic storage device that, when prompted, randomly displays electronically stored messages on a LED type screen. The product is encased in a plastic housing of unique shape, for instance a heart shape. This device has a switch to turn it on, which has three positions. The first is the off position. The second makes a light in the device flash, so as to notify a person that the device is turned on. The third position causes the random message is displayed. The combination of these aspects is what is being claimed.
